shirts

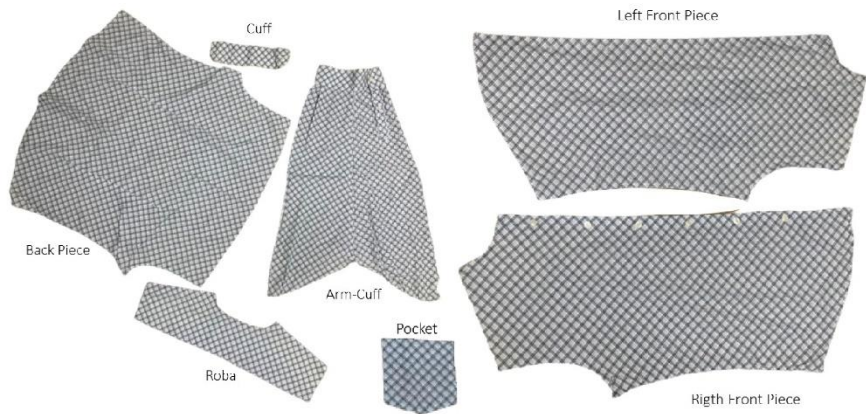

İpek KARATOP

All collection pieces designed for today's fashion. The aim to make a difference by making designs that people can find something of themselves. In this, plain colored and patterned shirts will be made. I will prove to people that upcycle products can be stylish and wearable.

The main purpose is to transform the previously made production wastes into a new wearable clothes. Men's shirts will be used for this. It is a concept that I created and influenced by the DENHAM website.

Sustainable raw materials are generally used in men's shirts, such as cotton. Producing a shirt such as fabric costs is difficult to company. So we need to know the value of the products which are already produced. The fact that the shirts have many pieces is reflected in the designs.

Trials were made on the dummy in many ways, by tearing a shirt into pieces. By making these experiments, it was understood how my drawings should be developed and how they should look. Just as I designed the front bodies of the designs, the stances of each of them on the back body were also designed.
